## Homework #7

Due: Wed., Nov. 15<sup>th</sup>, 2017

Let  $\mathfrak{g}$  be a Lie algebra over a field  $\mathbb{F}$ .

- #1 Dualing Problem: Consider  $\beta = \{(1,0,1), (1,2,0), (0,1,-1)\}$  (this is a basis for  $\mathbb{R}^3$ ).
  - (a) Find the dual basis  $\beta^*$ . [Give formulas for each dual vector. For example: f(x, y, z) = 2x + 5y z. Unnecessary note: f is **not** one of the elements of  $\beta^*$ .]
  - (b) Explain why  $f(x, y, z) = x^2$  is not in  $(\mathbb{R}^3)^*$ .
  - (c) Explain why f(x, y, z) = x is in  $(\mathbb{R}^3)^*$  and compute  $[f]_{\beta^*}$  (this is f's  $\beta^*$ -coordinate vector).
  - (d) Find the change of basis matrices from  $\operatorname{std}^* = \{\mathbf{i}^*, \mathbf{j}^*, \mathbf{k}^*\}$  (the standard dual basis) to  $\beta^*$  (i.e.  $[I]_{\operatorname{std}^*}^{\beta^*}$ ). Also, find the change of basis matrices from to  $\beta^*$  to  $\operatorname{std}^*$  (i.e.  $[I]_{\beta^*}^{\operatorname{std}^*}$ ).
  - (e) What is the relationship between  $[I]_{\mathrm{std}^*}^{\beta^*}$  and  $[I]_{\mathrm{std}}^{\beta}$ ? Given two arbitrary bases  $\alpha$  and  $\gamma$  for an arbitrary finite dimensional vector space (over some field  $\mathbb{F}$ ), conjecture a relationship between  $[I]_{\alpha}^{\gamma}$  and  $[I]_{\alpha^*}^{\gamma^*}$ .
  - (f) [Grad Students] Prove your conjecture from part (e).
- #2 Look at me, Mom. I'm a module too! Let V and W be  $\mathfrak{g}$ -modules.
  - (a) The space of linear maps from V to W can be turned into a  $\mathfrak{g}$ -module as follows: Let  $T \in \text{Hom}(V, W) = \{S : V \to W \mid S \text{ is linear}\}$  and  $g \in \mathfrak{g}$ . Then for all  $\mathbf{v} \in V$ , define

$$(x \bullet T)(\mathbf{v}) = x \bullet T(\mathbf{v}) - T(x \bullet \mathbf{v}).$$

First, show  $x \bullet T \in \text{Hom}(V, W)$ . Then show that this turns Hom(V, W) into a  $\mathfrak{g}$ -module (don't forget to check bilinearity).

- (b) We can turn  $\mathbb{F}$  into a  $\mathfrak{g}$ -module via the trivial action:  $x \bullet s = 0$  for all  $s \in \mathbb{F}$ . Explain how this then allows us to define a dual module  $V^*$  for any  $\mathfrak{g}$ -module V [Hint: Use part (a).] What is the action of  $\mathfrak{g}$  on  $V^*$ ?
- #3 Like Mt. Fuji Reflected in a Lake: Recall that V(m) is the  $\mathfrak{sl}_2(\mathbb{C})$  module with highest weight m (where m is a non-negative integer).
  - (a) Prove that  $V(1)^* \cong V(1)$ .
  - (b) [Grad Students] Prove  $V(m)^* \cong V(m)$ .
  - (c) [**Everyone**] Assuming the grad student problem (part (c)) and the fact that as  $\mathfrak{g}$ -modules:  $\left(\bigoplus_{i=1}^{\ell} W_i\right)^* \cong$

 $\bigoplus_{i=1}^{\ell} W_i^* \text{ (for any finite dimensional } \mathfrak{g}\text{-modules } W_i), \text{ prove that } V^* \cong V \text{ for any finite dimensional } \mathfrak{sl}_2(\mathbb{C})\text{-module } V. \text{ Slogan: } \mathfrak{sl}_2\text{-modules are self dual!}$
